

Random Testing Quiz

For my random character, first I needed to see the range of ASCII values I needed, so I looked it up online. The 'space' ASCII value is the lowest at 32, and the highest ASCII value needed was '}' at 125. To randomly generate a value between these ranges, I used the formula:

`rand()%(max_value+1 - min_value) + min_value`

This should randomly generate any character between 'space' and '}', inclusive.

For my random string, I made a for loop for a string of size 6 and filled it with random characters between the range that 'reset\0' would fall. '\0' being the lowest at ASCII value 48 and 't' being the highest at 116.
